Introduction

WEB-T is a Drupal extension for automated content translation. To use this extension, you will need to have a **Drupal website**.

Your website should have Drupal version 8.9 or later – extension depends on the Drupal core localisation modules for translation management, editing and language selection.

How it works

The extension translates the webpage content when creating a new article or page. You can also pre-translate the existing website content all at once by selecting languages and content types in **Configuration > WEB-T Settings > Machine Translation**. All translations are saved in your database, allowing you to edit them as regular Drupal content.

- 1. Install extension.
- 2. Configure translation languages, domains, and translatable content.
- 3. Add language switcher to your website.
- 4. Get MT provider access.
- 5. Configure the WEB-T Drupal extension.
- 6. Translate content on new page/article creation or pre-translate your existing website content.
- 7. Edit translated pages and articles as regular content.

Please note: Websites using WEB-T plugin with eTranslation integration enabled must be published and accessible online from eTranslation service. Translation with eTranslation will not work otherwise.

Install extension

Using Composer

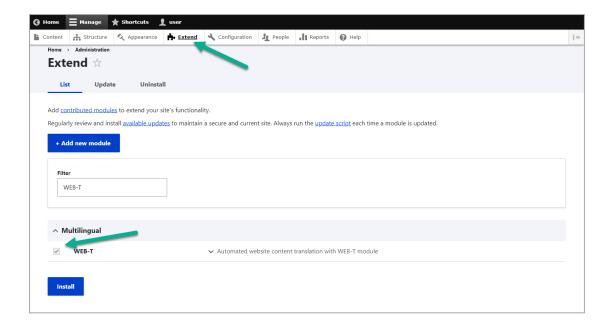

To install the extension:

- 1. Using console execute the following command in your website workspace: composer require 'drupal/webt:^1.0'
- 2. Open the Drupal administrator dashboard.
- 3. Open Extend.
- 4. Find the WEB-T extension and click the checkbox at the start of the row to enable.
- 5. At the bottom of the page, click **Install**.

From installation file (ZIP, TAR.GZ)

To install the extension:

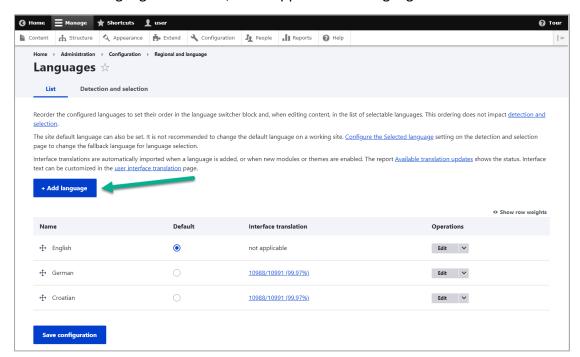

- 1. Open the Drupal administrator dashboard.
- 2. Open Extend.
- 3. On the top of the page, click **Add new module**.
- 4. Click **Choose File** and upload the .zip or .tar.gz archive of the extension.
 - a.ZIP file can be downloaded from WEB-T website (https://website-translation.language-tools.ec.europa.eu/solutions/web-t-drupal-en) or Drupal module repository (https://www.drupal.org/project/webt)
 - b. Alternatively, you can paste the direct download link in the **Add from a URL** field.
- 5. Click Continue.
- 6. A success message should be displayed.
- 7. (Optional) Clear cache by opening **Configuration>Performance** and clicking **Clear all caches** or by running drush cr command.
- 8. Click Enable newly added modules.
- 9. On the modules list, find the **WEB-T** extension and click the checkbox at the start of the row to enable.
- 10. At the bottom of the page, click Install.

Configure translation languages

To configure the translation languages:

- 1. Open the Drupal administrator dashboard.
- 2. Open Configuration.
- 3. Under Regional and language, click Languages.
- 4. Click Add language.
- 5. Select the language from the dropdown menu and click Add language.
- 6. After the language is installed, it will appear in the language table.

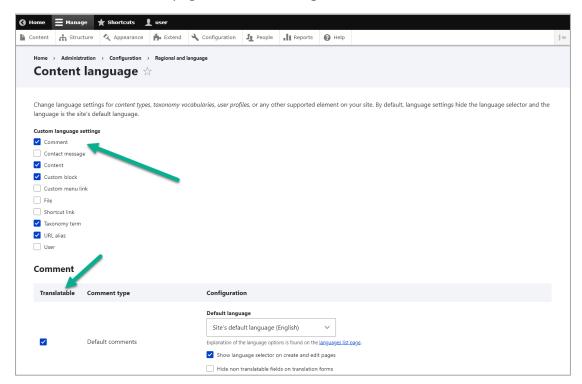

Configure translatable content

Decide whether each type of content entity (node pages, comments, custom blocks, taxonomy terms, user accounts, etc.) should be translatable or not. Then, within each entity type, you can decide whether the sub-types (content types for node page content, terms in particular vocabularies for taxonomy, etc.) should be translated.

To configure translatable content:

- 1. Open the Drupal administrator dashboard.
- 2. Open Configuration.
- 3. Under Regional and language, click Content language and translation.
- 4. On the top of the page, select the content types you want to translate.
- 5. Go through the table and enable **Translatable** at the start of each row.
- 6. At the bottom of the page, click **Save configuration**.

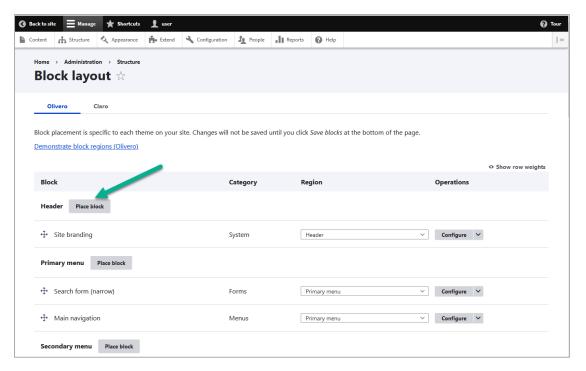

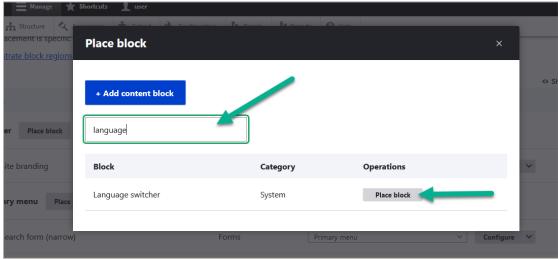

Add language switcher

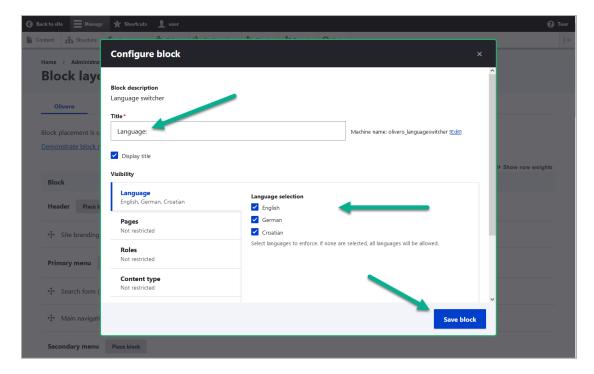

Add the language switcher block where you want it to appear on your page.

To add the language switcher to the page:

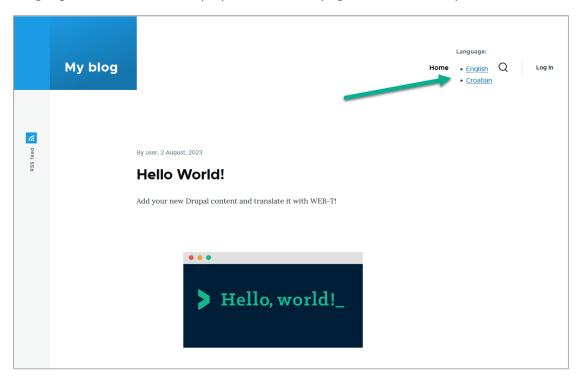

- 1. Open the Drupal administrator dashboard.
- 2. Open **Structure > Block layout**.
- Decide on the placement (header, footer, primary menu etc.) and click Place block.
- 4. Find Language switcher and click Place block.
- 5. Configure the block by changing the title, visibility, and languages.
- 6. Click Save block.

Language switcher will be displayed on the webpage in the selected position.

WEB-T settings overview

After you have installed the extension, open **Configuration** on the Drupal administration dashboard. You will find **WEB-T Settings** under **Regional and language** settings.

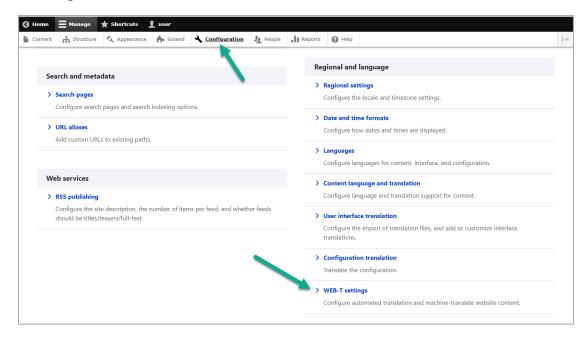

In WEB-T settings you will find:

- Translation provider for setting the translation provider authorisation information (eTranslation API credentials or Base URL & API key) and selecting machine translation engines. "Advanced" settings for setting timeout and maximum request size for the translation provider.
- Machine translation for following the translation progress, pre-translation and deleting translations.

Configure WEB-T extension

Open WEB-T settings

WEB-T settings can be found under Configuration > Regional and languages > WEB-T Settings.

Configure translation provider

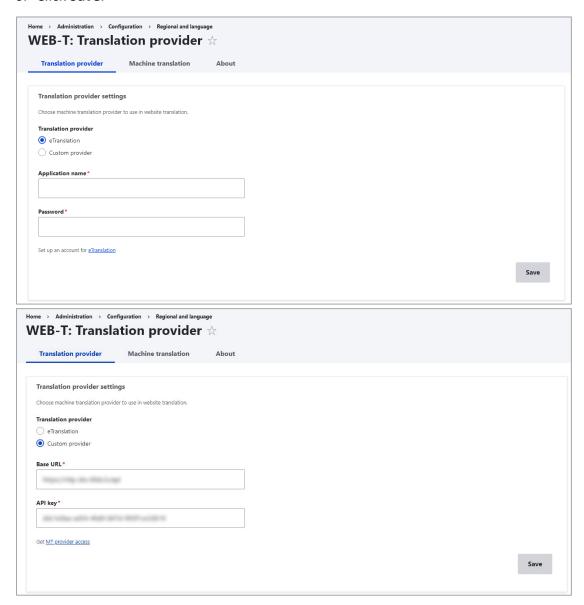

Before you continue:

You must have an eTranslation or WEB-T compatible translation provider account. You have obtained the eTranslation API credentials or Base URL & API key from your translation provider.

You have configured the translation languages.

To configure the translation provider:

- 1. Open Configuration.
- 2. Under Regional and language, click WEB-T settings.
- 3. Select the translation provider.
- 4. For eTranslation enter the application name and password; for the Custom provider specify the provider's generic MT API URL and API key.
- 5. You can change the translation request size later under **Advanced**.
- 6. Click Save.

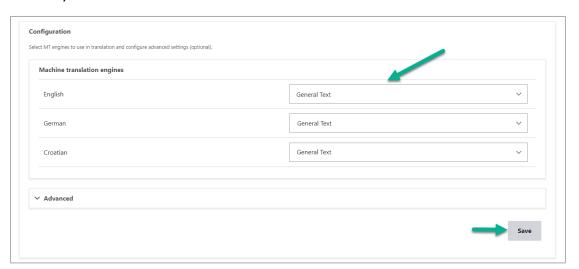

Configure machine translation

To select machine translation engines to use in translation:

- 1. In WEB-T settings, open the Translation provider tab.
- 2. Under **Configuration**, select the engines from the dropdowns next to the corresponding languages.
- 3. Click Save.

Languages that are not supported by the machine translation provider will not have any engines to choose from on the menu. However, they can still be translated manually.

Configure MT notice

To add a notice informing users that the content may be machine translated:

- 1. Go to **Structure->Block layout.**
- 2. Choose a region that appears on every page, e.g., Header. Note: position of the MT notice will not change based on region MT notice bar will always appear at the top of the page. Click **Place block.**
- 3. Find a block called "Machine translation notice" and click Place block.
- 4. Configure the block's visibility settings for example, by language. Typically, you would select every language supported by your MT provider, except for the source language. That way the MT notice will be shown for every language that may be machine translated.

To manually edit the MT notice text for each language, find and update its translation in the User interface translation settings.

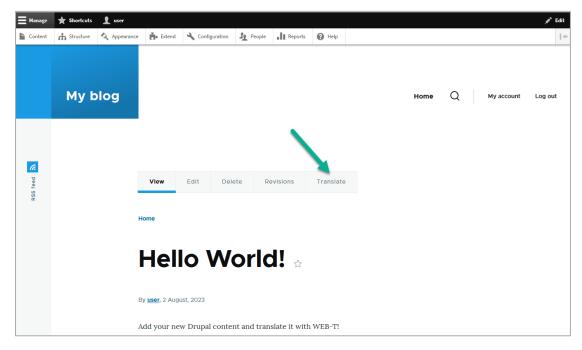

Translate content

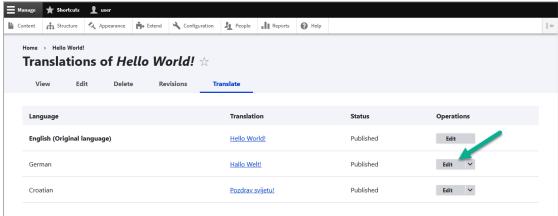

Translate new content

To add and translate new content:

- 1. Create a new page or article.
- 2. Click Save.
- 3. Browser tab will display a loading indicator while the content is being translated. Article will reload.
- 4. Click **Translate** tab to view a list of translated pages.
- 5. Click **Edit** to make changes to the translated content.

If your administration panel language keeps changing, but you wish to keep it in the default language, see <u>Administration panel language keeps changing.</u>

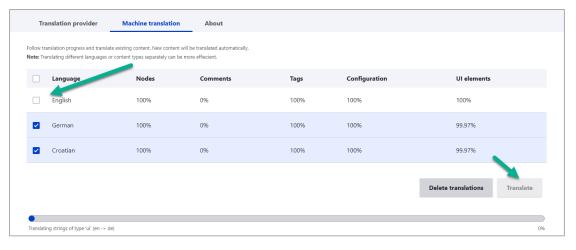

Translate existing content (Pre-translation)

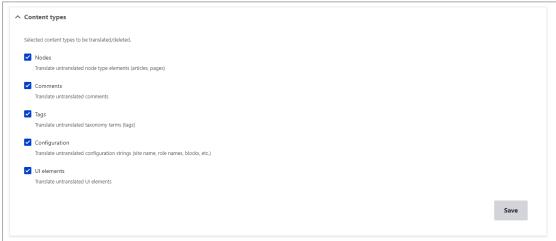

You can translate existing content and UI elements in the **Machine translation** tab of the **WEB-T settings**. This is useful when you're adding a new language to your website or integrating the extension with a website that already has content.

To translate existing content:

- 1. In WEB-T settings, open the Machine translation tab.
- 2. In the table select the languages.
- 3. Under **Content types**, select the content to translate.
- 4. Click Translate.
- 5. To view and edit translations, see Edit translations.

Translating different languages or content types separately can be more efficient.

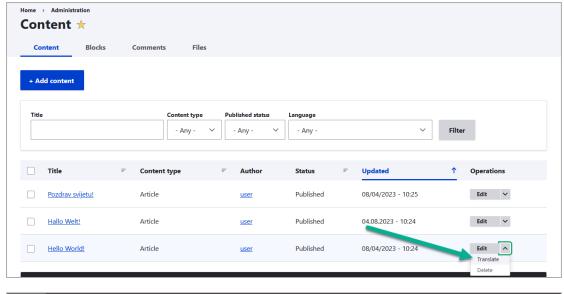

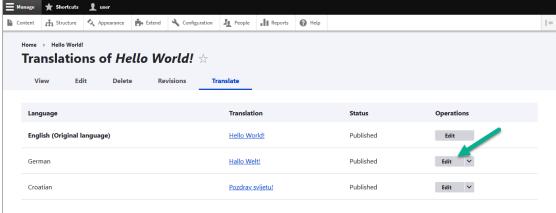

Edit translations

Translations are created as separate articles, so they can be edited in the same way as the original content.

To edit translated content:

- 1. Open Content.
- 2. Find the original article and click **Translate**.
- 3. On the list of pages, find the translation you want to edit.
- 4. Open the **Edit** tab to update the translation.
- 5. After making changes, click **Save (this translation)** at the bottom of the page.

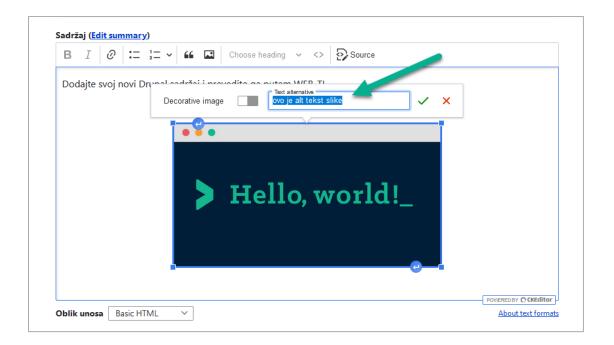

Edit image alt text translation

To edit image alt text translation:

- 1. Open the translated article.
- 2. Click on the image and edit the alt text.

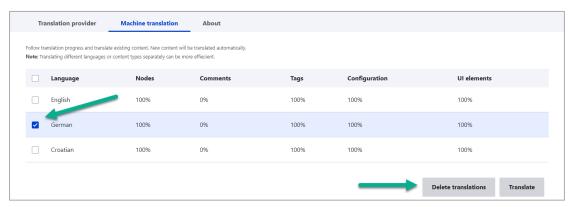

FAQ

How to delete translations?

To delete translations:

- 1. Open Configuration.
- 2. Under Regional and language, click WEB-T settings.
- 3. Open the Machine translation tab.
- 4. Select the languages and content types.
- 5. Click **Delete translations**.

Go to Drupal's language settings to remove languages completely.

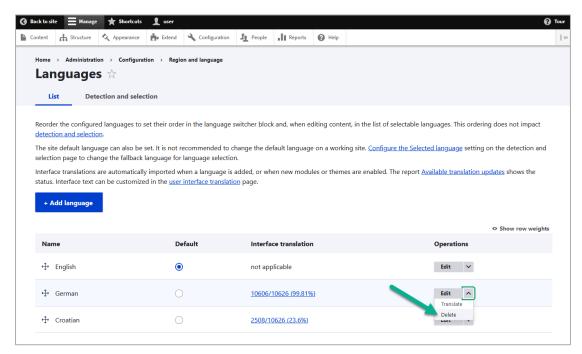

Content types can be selected under Content types:

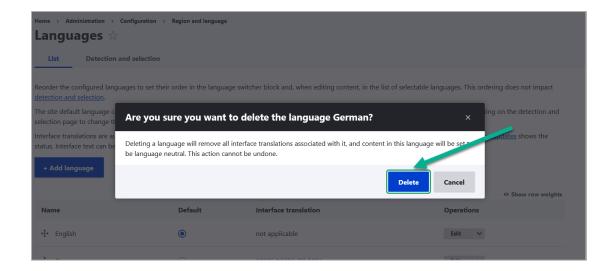

How to remove translation language?

To remove the language (after deleting associated translations):

- 1. Open Configuration.
- 2. Under Regional and language, click Languages.
- 3. Find the language you want to remove, click **Delete**.
- 4. In the confirmation window, click Delete.

How to change eTranslation timeout and request size?

You can change the translate request size and eTranslation timeout in the plugin's settings under **WEB-T settings > Translation provider > Configuration > Advanced**.

How to change the request size for a custom translation provider?

You can change the translate request size in the plugin's settings under **WEB-T** settings > Translation provider > Configuration > Advanced.

How to update translations after changing translation engine?

To update the existing translations after changing the machine translation engine or translation provider:

- 1. Delete the old translations for the specific language, see <u>How to</u> delete translations,
- 2. Translate all, see Translate existing content (Pre-translation).

Does the extension translate images and media content?

Images and media content must be localised by the user themselves and added into the translated pages.

Will the translation affect website load times?

There is no noticeable difference in load times between translated content and regular articles. If a page is not pre-translated the visitor will have to wait for the translation.

Troubleshooting

Translation doesn't work

Websites using WEB-T plugin with eTranslation integration enabled must be published and accessible online from eTranslation service. Translation with eTranslation will not work otherwise.

To fix this, publish these websites online and make sure these URLs are accessible from outside (e.g. by making HTTP POST requests):

{{WEBSITE_URL}}/etranslation/translation/123

Translation is slow

Translation speed is dependent on the translation provider. Systems offered by eTranslation are used by a huge number of users. They may be slow at times due to the heavy workload.

The first time the content of any page is loaded it will take some time to translate it. The translation will be saved and returned instantly the next time.

See: <u>How to change eTranslation timeout and request size?</u> and <u>How to change the request size for a custom translation provider?</u>

Translation contains errors

Machine translation cannot fully substitute human translators. The translations must be reviewed and edited by a human. The quality of the translation depends on the machine translation engine and provider.

Administration panel language keeps changing

If your administration panel language keeps changing when selecting a language from the language switcher, you have to change your Drupal settings, see official Drupal documentation.
